### 1. Introduction

"Giant Worm" is a procedural PBR character designed for video games developers. The procedural aspect means there are virtually unlimited looks you can give to the character, creating a unique look that no one else has. Physically Based Rendering means the look can appear hyper realistic.

Due to all of this, there is a little setup involved. It shouldn't take long and maybe it'll be quite fun, as you'll get to fine-tune the look of your character.

In most cases the Quick Set Up section will be all that you need. If you're interested in knowing more about each of the values you're able to tweak, check out the Procedural Values section.

For advanced users, if you're interested in scripting run time changes in the texture of the model, refer to the Scripting section.

Finally we include a brief list of the Animations currently included.

We plan on updating our assets periodically, so please check the Asset Store for available updates.

We highly suggest you create your textures in a new project, and import your finished texture maps into your game project.

# 2. QUICK SET UP

This quick guide will work for most users, and does not allow for run time changes in the look of the textures. For videos, please visit our website at www.InfinityPBR.com where you will find much more detailed examples. We highly suggest you create your maps in a new, empty project.

- 1. Load the Assets/SFBayStudios/SFB Demo Scenes/SFB Giant Worm Texture Creation.unity scene
- 2. Select the main Procedural Material in the inspector. Assets/SFBayStudios/SFB Giant Worm/Procedural Materials/SFBv#\_GiantWorm\_v#
- 3. Make any adjustments you'd like to the "Head" section. Be sure to check the "Enable Texture Modification" box under the top "Main" section. Also make any adjustments to the Environment options, such as Ground Dirt, Damage etc. Also modify the "Skin" & "Spikes".
- 4. (Alternatively, you can create your own "Copy This To That" controller object where all sections copy their data from the "Head" section. However, I felt that the Skin & Spikes were different enough materials that you may want more control.)
- 5. In the scene view, select "Copy This To That Control". This editor script (see Inspector) will copy the settings from "Head", "Skin" & "Spikes" to all the listed sections in the target materials. You can add or remove them as you'd like, but if you plan on making a custom Copy This To That controller, I suggest you create a new object, and keep the demo defaults as is. *Visit www.infinityPBR.com/CopyThisToThat/ for a "cheat sheet" of section names in each Procedural Material.*
- 6. Click the "Copy Settings" button, and wait until all materials are finished updating. You'll see them update in the scene view, but it may take a few moments.
- 7. Do the same for the 2nd Copy This To That Controller.
- 8. If you want to make any more modifications to individual parts or materials, do so now. If you click "Copy Settings" again, any changes you make will be lost.
- 9. When you are satisfied with the look of your model, select the "Mass Exporter" object. In the inspector, confirm that all of the Procedural Materials are seen in the "Substances" array. Give your new character a descriptive name, such as "Blue Worm #1", and choose whether to remove Emissive & Height maps. If you are going to share maps with a previous export, add the "Previous Group Name" and select which maps to share. If this is your first export, or you've changed so much of the look that you can't share maps, uncheck the boxes. Finally, click "Export Materials." It will take a few minutes for Unity to import all the .tga files that are created.
- 10. When complete, you'll find your game-ready materials in Assets/SFBayStudios/Exported Materials/ [Group Name]
- 11. Don't forget to choose the correct LOD for your game, and play with the size settings of the textures to optimize their system resource usage.

#### SPECIAL NOTES

There are some potential "bugs" that you may have to deal with.

- 1. Sometimes after dragging the created Standard Shader materials onto the object, you'll need to click on the object, and expand the material in the Inspector. Unity seems to not update the material until after you do so.
- 2. Our automated texture export should put the MetallicRoughness map into the Metallic field, but sometimes it puts the map called "Z\_Metallic" instead. If this happens, the object will look funny, and likely be very reflective. You'll need to manually place the MetallicRoughness map into the Metallic field if this happens. [Unity uses the alpha channel of the Metallic field as the roughness map.]
- 3. The "Export Material" menu option does not work in 5.3.4.

### 3. Procedural Values

Here you'll find greater details on what each value does and how it may be used. There could be a great many ways to use the value options, often with each other, that we don't know about or don't talk about here. Take a moment and play around with it and see what you can do! The ID is used for scripting run time changes.

#### ${\sf SFB\_RT\_Mushroom\_Color}$

Category Name ID   Type Min, Max Description			
			<u> </u>
Stem	Hue	StemHue float (0.0,1.0)	Hue
	Saturation	StemSaturation float (0.0,1.0)	Saturation
	Lightness	StemLightness float (0.0,1.0)	Lightness
	Contrast	StemContrast float (-1.0,1.0)	Contrast
Bumps	Hue	BumpsHue float (0.0,1.0)	Hue
	Saturation	BumpsSaturation float (0.0,1.0)	Saturation
	Lightness	BumpsLightness float (0.0,1.0)	Lightness
	Contrast	BumpsContrast float (-1.0,1.0)	Contrast
Head	Hue	<pre>HeadHue float (0.0,1.0)</pre>	Hue
	Saturation	HeadSaturation float (0.0,1.0)	Saturation
	Lightness	<pre>HeadLightness float (0.0,1.0)</pre>	Lightness
	Contrast	<pre>HeadContrast float (-1.0,1.0)</pre>	Contrast

#### SFB\_RT\_SFX

Category	Name	ID   Type Min,Max	Description
	Water Level	SFXWaterLevel float (0.0,1.0)	How much water
	Water Details	SFXWaterDetails float (0.0,1.0)	Details of the water

Category	Name	ID   Type Min, Max	Description
	Refraction	SFXRefraction float (0.0,1.0)	Refraction of the water. (Try 0 for an "ooze" look)
	Reflection	SFXReflection float (0.0,1.0)	Reflection amount
	Reflection Distance	SFXReflectionDistance float (0.0,1.0)	Reflection distance
	Flow Direction	SFXFlowDirection float (0.0,1.0)	Changes the direction the water appears to be flowing
SFX	Water Color	SFXWaterColor Color	Color of the water (clear = default)
	lce	SFXIce float (0.0,1.0)	How much of the water has turned to ice? Water is required for this to work.
	Ice Details	SFXIceDetails float (0.0,1.0)	Details of the ice
	Snow	SFXSnow float (0.0,1.0)	Amount of snow
	Moss	SFXMoss float (0.0,1.0)	Amount of moss
	Moss Scale	SFXMossScale int (1,4)	Scale of the moss texture
	Moss Color	SFXMossColor Color	Color of the moss

### SFB\_RT\_TextureBlend

Category	Name	ID   Type Min,Max	Description
N/A	Blend Amount	blendAmount float (0.0,1.0)	Blend amount between Texture group 1 and Texture group 2.

### 4. SCRIPTING

It's possible to change values during run time. We include a few versions of the material, some of which are optimized for common run-time options. In those cases, you'll likely want to bake maps for the base materials you plan on using (which do not change at run time), and use the optimized versions. This will speed up the changes in game.

Please Note: We are not the best coders. There may be more ways of doing what we're doing, perhaps better ways. Please use the forums on our site and the Unity forums if you'd like to discuss or ask the community about various ways of doing this. **We are also using Unity Script because, simply, it's what we currently understand.** Check out our demo scripts for more extensive examples.

```
: ProceduralMaterial;

// Set an Int or a Float value
substance.SetProceduralFloat("Grunge2Volume", 0.5);

// Set a Color value
substance.SetProceduralColor("Grunge2Color", Color(1,1,1,1));

// Get a Vector2 value
var currentOffset : Vector2 = substance.GetProceduralVector("Grunge2Offset");

// Set a Vector2 value
substance.SetProceduralVector("Grunge2Offset", Vector2(currentOffset[0],currentOffset[1]));
```

Note: Visit http://www.InfinityPBR.com for tutorials and videos showing more things you can do with our work.

### 5. ANIMATIONS

We've included a sizable selection of animations designed specifically for this character. Read about them here. Many, if not all, can be looped in various ways inside Unity to create animation combinations. You can find the animations by expanding the main model in the "x\_Model" folder. Drag the animations into an Animator Controller to use them. Select the main model and click the "Animations" tab to add events.

Animation	Looped?	Description
Appear	No	The worm appearing from under the ground
Attack01	No	A standard biting attack forward
Attack02	No	The worm spins in a large circle, close to the ground
Attack03	No	A "breath" spell
Block01	No	The entry into the Block loop
Block02	Yes	A looped animation showing the worm blocking
Block03	No	The exit of the block loop. Cut directly to this for a "quick" block motion
Death	No	Death of the worm
Disappear	No	The worm disappearing into the ground
GotHitBody	No	A reaction to being hit in the body
GotHitHead	No	A reaction to being hit in the head
Hidden	Yes	Short loop for when the worm is hidden under ground
Idle	Yes	Idle Loop
IdleBreak	No	Break from the idle loop

## 6. LEVEL OF DETAILS

There are multiple level of details available. Each LOD has value depending on your project and needs. Generally it's best to figure out what's the lowest resolution you can use for your project, and go with that.

LOD	Tris
GiantWorm	37.2k
Worm_LOD1	18.6k
Worm_LOD2	9.3k
Worm_LOD3	4.7k
Worm_LOD4	2.3k
Worm_LOD5	1.2k

# 7. Change Log

v5	Added "Mass Exporter" script to Texture Customization scene, which allows users to export game-ready textures and materials with a single click.		
	Fixed some bugs in the Demo, removed Procedural Changes in the demo.		
_	Added a "Base Material" graph to create metal & non-metal basic substances		
V4	Removed Metal Option		
	Updated Procedural Material to make it load faster with more options		
	Fixed prefab issue		
	Included Position Map for use with Directional Blood and potential future Runtime Materials		
v3	Added Run Time Materials Directional Blood & Texture Blending		
	Updated folder structure in project.		
v2	Initial Version.
